In order to provide an elementary introduction to kinetic theory, physical systems in which particle particle

interaction can be neglected are considered. Transport phenomena in the free molecular flow region for gases and the transport of thermal radiation are discussed. Discrete random processes such as random walk, binomial and Poisson distributions, and throwing of dice are studied by means of the characteristic function.

of the theory. To simplify the presentation, we restrict the derivation to a one dimensional system. There were two major points in Einstein's solution of the problem of Brownian motion: • The motion is caused by the exceedingly frequent impacts on the pollen grain of the incessantly moving molecules of liquid in which it is suspended.
